

## **Canon U.S.A., Inc., is Honored with Two 2020 'ASTORS' Homeland Security Awards**

### **Platinum Award, Best Email Security Solution: mxHero + Canon MFP**

mxHero\* + Canon MFP have been deemed a Platinum Award winner in the Best Email Security Solution category as a result of its ability to provide an additional layer of email security features and control over email attachments by leveraging powerful cloud storage platforms like Box (purchased separately) to replace scanned email attachments with secure file links.

A cloud service for intelligent email management, mxHero Secure Scan-to-Email feature can integrate with a Canon MFP to help customers collaborate in a safe manner, govern, manage and share information. This solution provides security measures that help control access to attachments without changing the end user's scan workflow. With support for both imageRUNNER ADVANCE and imageCLASS multifunction printers, mxHero helps administrators keep control of email attachments whether they are being scanned in the office, or in a home office environment – addressing today's hybrid work model.

### **Silver Award, Best Access Control & Authentication**

#### **System: imageRUNNER ADVANCE DX Series + uniFLOW Online + Print via Cloud**

In addition, Canon's imageRUNNER ADVANCE DX Series + uniFLOW Online + Print via Cloud combination receives a Silver Award in the category of Best Access Control & Authentication System due to its simple, flexible design, advanced scanning, strong security features, enhanced cloud functionality and usability.

Designed to help customers keep control of access to their systems and critical information, this combination of the MFP and print management solution can help limit unauthorized use and keep valuable and confident information safe. With uniFLOW Online, administrators can establish a requirement for users to identify themselves at the imageRUNNER ADVANCE DX device and leverage Secure Print functionality so that documents can only be printed when the user is physically standing at the device and authenticates – regardless of whether the user submitted the print job from their desktop or mobile device.
